

# Project description

Delivery Proposal:

μWeather,

the purpose of μWeather is to gather weather information from multiple weather services and see how concordant they are.

Based on the concordance we will set a likeliness of the prognosis to be correct.

Extensibility

- provide recommendations to prepare for rain ("bring umbrella")
- make use of registered personal Weather Stations
- provide a historical perspective on weather changes over time to make the user aware of climate issues and their effects
- We will adjust this likeliness value based on historic comparisons between our prognosis and likeness prediction and actual outcome.
